PREFACE

THESE tables are intended primarily for use in connection with our *Plane Trigonometry and Applications*. But they may be used equally well with other texts, and for the purposes of surveying and engineering practice. We believe that they have the following advantages over other similar compilations.

1. *The typography and spacing.* Continued use of numerical tables is usually hard on the eyes. We have attempted to relieve the strain on the computer's eyes by the use of generous spacing and variety of type.

2. *The presence of Table III.* Most collections of tables either make no provision at all for the logarithms of the functions of small angles, or else depend entirely on the use of the auxiliaries S and T , which are apt to be somewhat obscure to the beginner.

3. *Table IV, for the auxiliaries S and T ,* has been calculated on the assumption that the angle is expressed in minutes. In most other collections, these quantities are tabulated for angles expressed in seconds, which is far less convenient for most purposes.

4. *A table of the values of the natural functions* to five decimal places is practically useless, unless the computer has access to large product tables, or uses a computing machine. We have therefore inserted a four-place table of the natural functions, giving their values for every tenth of a degree.

5. *The table of squares in any collection* should permit the same degree of accuracy as the corresponding table of natural functions. We have therefore included a four-place table of squares (reproduced from Bremiker), arranged just like a table of logarithms and in a form actually adapted to trigonometric work rather than to the theory of numbers. Most of the tables of squares which have appeared in our trigonometries are so cumbersome and inconvenient as to be practically useless.

6. *The three-place tables IX, X, and XI* are, on account of their compactness, especially useful for calculations involving no more than three digits. By means of these tables a somewhat greater accuracy, and about the same speed may be attained as with the ordinary size of slide rule. They have the further advantage of enabling the computer to avoid a considerable part of the strain which careful slide rule work produces upon the eye.

In compiling this work, use has been made of various standard tables, notably those of Bremiker.

INTRODUCTION TO THE TABLES

TABLE I

1. Definition of a common logarithm. *The common logarithm of any positive number N is the exponent of the power to which the base 10 must be raised in order to produce the number N .*

2. Properties of logarithms. The following properties of logarithms are of importance for the purposes of numerical calculation.*

1. *The logarithm of a product is equal to the sum of the logarithms of its factors.*

2. *The logarithm of a quotient is equal to the logarithm of the dividend minus the logarithm of the divisor.*

3. *The logarithm of the p^{th} power of a number M is obtained by multiplying the logarithm of M by p .*

4. *The logarithm of the n^{th} root of a number M is obtained by dividing the logarithm of M by n .*

5. *The logarithm of ten is equal to unity.*

6. *The logarithm of unity is equal to zero.*

The positive integral powers of 10, such as 10, 100, 1000, etc., the negative integral powers of 10, such as 0.1, 0.01, 0.001, etc., and the zero power of 10, which is equal to 1, are the only numbers whose common logarithms are integers. The logarithms of all other numbers have an integral and a fractional part.

*The fractional part of the logarithm is called the **mantissa**, while the integral part of the logarithm is known as its **characteristic**.*

3. Properties of the mantissa. We consider the mantissa and the characteristic separately because, in practice, the method for finding the characteristic of a logarithm is entirely different from that employed for finding its mantissa. The reason for this will appear from the following discussion.

* For a proof of these properties, see *Plane Trigonometry and Applications*, by E. J. WILCZYNSKI, edited by H. E. SLAUGHT.

Let us grant that we have found out in some way that

$$(1) \quad \log 1.77828 = 0.25000.$$

From the theorem about the logarithm of a product, we conclude

$$\log 17.7828 = \log (1.77828 \times 10) = \log 1.77828 + \log 10 \\ = 0.25000 + 1 = 1.25000,$$

$$\log 177.828 = \log (1.77828 \times 100) = \log 1.77828 + \log 100 \\ = 0.25000 + 2 = 2.25000,$$

.

We observe that the numbers 1.77828, 17.7828, 177.828, etc., contain the same succession of digits, and differ from each other only in the position of the decimal point. Their logarithms, on the other hand, whose values we have just calculated, differ from each other only in the value of the characteristic.

Again, if we make use of the theorem about the logarithm of a quotient, we find from (1)

$$\log 0.177828 = \log \frac{1.77828}{10} = 0.25000 - 1,$$

$$\log 0.0177828 = \log \frac{1.77828}{100} = 0.25000 - 2,$$

.

Now, the negative quantities, which appear on the right members of these equations, are not written in the form which we ordinarily use for negative quantities. Thus, for instance, we have found the value of $\log 0.0177828$ to be $0.25000 - 2$, a result which we should ordinarily write in the form -1.75000 to which it is obviously equal. If we agree to write every negative logarithm in this unusual form, as a difference between a *positive proper fraction* and an integer, thus making its fractional part positive, we gain the advantage that the mantissas will be the same for any two numbers which contain the same succession of digits, even if none of these digits appear to the left of the decimal point. We avoid, in this way, the necessity of using two different tables of mantissas, one for numbers greater and one for numbers less than unity.

Let us recapitulate the result of our discussion in two formal statements.

I. *We agree to express the logarithm of any positive number N in such a form that its mantissa shall be positive.*

This can be done whether $\log N$ is positive or negative, that is, whether N be greater or less than unity. In the latter case, the negativeness of $\log N$ is brought about entirely by means of the negative characteristic.

As a consequence of this agreement, the following statement will be true in all cases.

II. *If two numbers contain the same succession of digits, that is, if they differ only in the position of the decimal point, their logarithms will have the same mantissa and will differ only in the value of the characteristic.*

It is for this reason that the tables give only the mantissas of the logarithms and that, in looking up the mantissas, we pay no attention to the position of the decimal point in the given number.

4. Determination of the characteristic. The characteristic of a logarithm is easily determined by inspection. Its value depends merely on the position of the decimal point. Since we have

$$10^0 = 1, 10^1 = 10, 10^2 = 100, 10^3 = 1000, \text{ etc.},$$

or

$$\log 1 = 0, \log 10 = 1, \log 100 = 2, \log 1000 = 3, \text{ etc.},$$

we draw the following conclusions :

If $1 < N < 10$, then $0 < \log N < 1$. $\therefore \log N$ has the characteristic 0.

If $10 < N < 100$, then $1 < \log N < 2$. $\therefore \log N$ has the characteristic 1.

If $100 < N < 1000$, then $2 < \log N < 3$. $\therefore \log N$ has the characteristic 2.

.

If $10^k < N < 10^{k+1}$, then $k < \log N < k + 1$. $\therefore \log N$ has the characteristic k .

We may formulate these results as follows :

III. *If k is a positive integer, and if the number N lies between 10^k and 10^{k+1} , the characteristic of $\log N$ is equal to k .*

Since such a number N has $k + 1$ digits to the left of the decimal point, we obtain the following rule :

IV. *If N is any number greater than 1, the characteristic of its logarithm is one less than the number of digits in its integral part.*

The student is advised to make but little use of this rule on account of its mechanical character. Statement III provides a better method (less mechanical and easier to remember), for determining the characteristic.

It remains to show how to find the characteristic of $\log N$ when $N < 1$.

If $.1 < N < 1$, then $-1 < \log N < 0$. $\therefore \log N$ has the characteristic -1 .

If $.01 < N < .1$, then $-2 < \log N < -1$. $\therefore \log N$ has the characteristic -2 .

If $.001 < N < .01$, then $-3 < \log N < -2$. $\therefore \log N$ has the characteristic -3 .

If $\frac{1}{10^{k+1}} < N < \frac{1}{10^k}$, then $-(k+1) < \log N < -k$. $\therefore \log N$ has the characteristic $-(k+1)$.

Examination of this table leads to the following two statements, either of which may be used to determine the characteristic of $\log N$ when $N < 1$.

If k is a positive integer, and if the number N lies between $\frac{1}{10^k}$ and $\frac{1}{10^{k+1}}$ the characteristic of $\log N$ is $-(k+1)$.

If N is less than 1, and if there are k zeros between the decimal point and the first significant figure of N when N is expressed as a decimal fraction, the characteristic of its logarithm is $-(k+1)$.

In one of our illustrations we had found

$$\log 0.0177828 = 0.25000 - 2.$$

We must never write this in the form

$$\log 0.0177828 = -2.25000,$$

since only the characteristic is negative and not the fractional part. Some computers use the notation

$$\log 0.0177828 = \bar{2}.25000;$$

but for most purposes it is preferable to write

$$\log 0.0177828 = 8.25000 - 10,$$

and similarly

$$\log 0.177828 = 9.25000 - 10.$$

In other words, *in actual practice, we write a positive characteristic $10 - k$ in place of the negative characteristic $-k$, and then subtract 10 from the whole logarithm.*

5. Arrangement and use of the table of logarithms. We have already mentioned the fact that the table of logarithms gives only the mantissas. The characteristics must be supplied by the computer by the methods of Art. 4.

Table I gives the mantissa, for every number from 1 to 9999, to five decimal places. In order to explain the arrangement and use of this table, we shall now solve a number of typical examples.

PROBLEM 1. Find the logarithm of 221.4.

Solution. To find the mantissa we ignore the decimal point. We read down the left-hand column of the table (headed N) until we find the first three digits of our number, viz.: 221. The numbers printed in the same horizontal row with 221 are, in order, the mantissas of the logarithms of 2210, 2211, 2212,, 2219, as indicated by the number at the head of each of the next ten columns. To save space, however, the first two digits of the mantissa are never printed more than once in each row. In our case we find the mantissa, from the column headed 4, to be .34518. Since 221.4 is between $100 = 10^2$ and $1000 = 10^3$, the characteristic is 2. Therefore

$$\log 221.4 = 2.34518.$$

PROBLEM 2. Find $\log 22.39$.

Solution. Looking for the mantissa as before, we find *005. The asterisk indicates that the first two digits of the mantissa are not 34, as one might suppose, but 35. The reason for this appears clearly from the table. Therefore

$$\log 22.39 = 1.35005.$$

If the number N contains more than four digits its logarithm cannot be read directly from the table. But it may be found by **interpolation**. We illustrate this process by an example.

PROBLEM 3. Find $\log 222.73$.

Solution. From the table we find, supplying the characteristics ourselves,

$$\log 222.70 = 2.34772$$

$$\log 222.80 = 2.34792$$

Tabular difference = $0.00020 = 20$ units of the fifth decimal place. Since 222.73 is $\frac{3}{10}$ of the way from 222.70 toward 222.80 we add $\frac{3}{10}$ of the tabular difference to $\log 222.70$. Therefore

$$\log 222.73 = 2.34772 + \frac{3}{10} \text{ of } 0.00020,$$

or

$$\log 222.73 = 2.34772 + 0.00006 = 2.34778.$$

The auxiliary tables in the margin, headed P P (abbreviation for proportional parts), facilitate the process of interpolation.

Thus, in problem 3, we refer to the auxiliary table with 20 (the tabular difference) at its head. In the third row we find $\frac{3}{16}$ of 20 or 6.0.

It remains to show how to find the number when its logarithm is given.

PROBLEM 4. Given $\log N = 9.34857 - 10$. Find the value of N to five significant figures.

Solution. The characteristic of $\log N$ is $9 - 10$ or -1 . Therefore, the number N must be between $10^{-1} = 0.1$ and $10^0 = 1$. Consequently, the decimal point will precede the first significant figure of N .

The mantissa 34857 does not occur in the table, but it falls between the two tabular mantissas 34850 and 34869. Thus we have:

$$9.34850 - 10 = \log 0.22310 \text{ (from the table),}$$

$$9.34857 - 10 = \log N,$$

$$9.34869 - 10 = \log 0.22320 \text{ (from the table),}$$

so that N lies between 0.22310 and 0.22320.

We observe that $\log N$ lies $\frac{7}{19}$ of the way from $\log 0.22310$ toward $\log 0.22320$. Therefore, N lies $\frac{7}{19}$ of the way from 0.22310 toward 0.22320. That is,

$$N = 0.22310 + \frac{7}{19} \text{ of 10 units of the fifth decimal place.}$$

But

$$\frac{7}{19} \text{ of 10 units} = \frac{70}{19} \text{ units} = 3\frac{8}{19} \text{ units.}$$

Since $\frac{8}{19}$ is more than one half, we call this 4 units, so that

$$N = 0.22310 + 0.00004 = 0.22314.$$

Also in this inverse problem (to find the number when its logarithm is given), interpolation is aided by the auxiliary tables in the margin.

Thus, in problem 4, the tabular difference is 19. The difference between $\log N$ and the smaller of the two tabular logarithms, between which N lies, is 7. The auxiliary table with 19 at its head shows that, among the tenths of 19, that one which comes closest to the value 7 is the fourth. Consequently, N is $\frac{4}{19}$ of the way from 0.22310 toward 0.22320. Therefore, up to five decimal places, $N = 0.22310 + 0.00004 = 0.22314$.

6. Cologarithms. Since we obtain the same result whether we divide N by M , or multiply N by $1/M$, we may, in a logarithmic calculation, add the logarithm of $1/M$ instead of subtracting $\log M$. *The logarithm of $1/M$ is called the cologarithm of M .* Therefore

$$\text{colog } M = \log \frac{1}{M} = \log 1 - \log M = -\log M,$$

since $\log 1$ is equal to zero.

Cologarithms, like logarithms, are written with a positive mantissa. Consequently, the cologarithm of a number is most easily found by subtracting its logarithm from zero,

written in the form $10.00000 - 10$, as in the following example.

PROBLEM 5. Find the cologarithm of 222.73.

Solution.

$$\begin{array}{r} 10.00000 - 10 \\ \log 222.73 = 2.34778 \\ \hline \text{colog } 222.73 = 7.65222 - 10 \end{array}$$

It is easy to perform this operation of subtraction from $10.00000 - 10$ mentally. There is no gain, however, from the use of cologarithms when we are dealing with a quotient of only two numbers. A real advantage is gained by the introduction of cologarithms, when more than two logarithms are to be combined by addition and subtraction. For the logarithms which are to be subtracted we then substitute cologarithms, enabling us to complete the operation by a single addition.

It often happens, just as in the case of forming a cologarithm, that we wish to subtract a logarithm from another smaller one. In all such cases we change the form of the minuend by adding and subtracting 10, or some convenient multiple of 10, as in the following example.

PROBLEM 6. Compute $\frac{32.34}{472.3}$.

Solution. We find from Table I,

$$\begin{array}{l} \log 32.34 = 1.50974, \\ \log 472.3 = 2.67422. \end{array}$$

In order to subtract the latter logarithm from the former, we write

$$\begin{array}{l} \log 32.34 = 11.50974 - 10,* \\ \log 472.3 = 2.67422 \\ \hline \log \frac{32.34}{472.3} = 8.83552 - 10 \end{array}$$

Hence (from the table), $\frac{32.34}{472.3} = 0.068473$.

7. Extraction of roots by means of logarithms. Since

$$\log \sqrt[p]{x} = \log x^{1/p} = \frac{1}{p} \log x,$$

it is easy to extract roots of any order by means of logarithms. If the characteristic of $\log x$ is not negative, no further remark is necessary. If $\log x$ is negative, we proceed as in the following example :

* A computer with some experience will refrain from actually writing the logarithm in the form $11.50974 - 10$. It is easy for him to carry out the calculation *as though* it were so written.

PROBLEM 7. Compute by logarithms: $\sqrt{.53760}$, $\sqrt[3]{.53760}$, and $\sqrt[5]{.53760}$.

Solution. $\log 0.53760 = 9.73046 - 10$.

$$\log \sqrt{.53760} = \frac{1}{2} \log 0.53760 = \frac{1}{2} (9.73046 - 20) = 9.86523 - 10.$$

$$\log \sqrt[3]{.53760} = \frac{1}{3} \log 0.53760 = \frac{1}{3} (29.73046 - 30) = 9.91015 - 10.$$

$$\log \sqrt[5]{.53760} = \frac{1}{5} \log 0.53760 = \frac{1}{5} (49.73046 - 50) = 9.94609 - 10.$$

Therefore, from Table I,

$$\sqrt{.53760} = .73322, \sqrt[3]{.53760} = .81312, \sqrt[5]{.53760} = .88326.$$

8. Logarithmic calculations which involve negative numbers.

We have defined only the logarithms of positive numbers. But this suffices for our purposes. Clearly, when we compute a product or quotient, its numerical value may be found first, without paying any attention to the signs of the various factors. Afterwards, the proper sign (+ or -) may be prefixed to the result according as there were an even or odd number of negative factors.

The easiest way to keep a count of the negative factors is to use the method, introduced by GAUSS, of writing the letter n immediately behind a logarithm which corresponds to a negative number. In forming a sum or difference of logarithms, we write an n after the result only if an *odd* number of the separate logarithms were affected by an n .

EXAMPLE. If $N = -221.73$, we write

$$\log N = 2.34778 n.$$

TABLE II

Table II gives the values of the logarithms of the trigonometric functions, to five decimal places, for every minute of arc. If the angle contains fractional parts of a minute, we obtain its functions from the table by interpolation.

The arrangement of this table resembles that of the table of natural functions so closely that it is unnecessary to describe it in detail. (Compare the description of Table V.) It should be noted, however, that, in this table, the characteristics of the logarithms are also given. But since the natural sines and cosines of all acute angles, and the tangents of all angles less than 45° , are proper fractions, their characteristics are negative and have been expressed in the form $9 - 10$, $8 - 10$, etc. *The continually recurring - 10 has not been printed*, and should be supplied by the computer. It is

understood, once for all, that 10 is to be subtracted from all of the logarithms in the first, second, and fourth columns of the table, while the logarithms printed in the third column are provided with their correct characteristic and require no such modification.

The process of interpolation may be applied to the table of logarithms of the trigonometric functions in the same way as to the table of natural functions or to the table of logarithms of numbers.

The following examples are intended to illustrate the application of Table II.

EXAMPLE 1. Find $\log \sin$, $\log \cos$, $\log \tan$, $\log \cot$ of $41^\circ 15' 35''$.

Solution. For convenience in interpolation convert $35''$ into decimal parts of a minute. Then $41^\circ 15' 35'' = 41^\circ 15'.58$.

We find, from the table,

$$\begin{aligned}\log \sin 41^\circ 15' &= 9.81911, \\ \log \sin 41^\circ 16' &= 9.81926,\end{aligned}$$

whence we conclude

$$\log \sin 41^\circ 15'.58 = 9.81911 + .58 \text{ of } 15 \text{ units of the } 5\text{th decimal place.}$$

Similarly

$$\log \tan 41^\circ 15'.58 = 9.94299 + .58 \text{ of } 25 \text{ units of the } 5\text{th decimal place.}$$

$$\log \cot 41^\circ 15'.58 = 0.05701 - .58 \text{ of } 25 \text{ units of the } 5\text{th decimal place.}$$

$$\log \cos 41^\circ 15'.58 = 9.87613 - .58 \text{ of } 12 \text{ units of the } 5\text{th decimal place.}$$

We may use the marginal tables of proportional parts to complete the interpolation. Thus, the table headed 15 shows that .5 of 15 is 7.5 and .08 of 15 is 1.2, and consequently .58 of 15 is 8.7 or 9 units of the fifth decimal place. Therefore

$$\log \sin 4^\circ 15'.58 = 9.81920 - 10.$$

In the same way we find

$$\begin{aligned}\log \tan 41^\circ 15'.58 &= 9.94314 - 10, & \log \cot 41^\circ 15'.58 &= 0.05686, \\ \log \cos 41^\circ 15'.58 &= 9.87606 - 10.\end{aligned}$$

EXAMPLE 2. Find the logarithms of the functions of $48^\circ 44'.42$.

Solution. This angle is the complement of that of example 1. Hence each of its functions is equal to the corresponding cofunction of $41^\circ 15'.58$, and the values obtained are the same as in example 1, with the name of each function changed to the corresponding cofunction.

Just as in the table of natural functions, these values, for angles greater than 45° , may be obtained directly from the table by reading the degrees of the angle at the *foot* of the page, the minutes in the right-hand column, and the name of the function at the foot of each of the four columns. We find, in this way,

$$\begin{aligned}\log \sin 48^\circ 44'.42 &= 9.87606 - 10, & \log \cot 48^\circ 44'.42 &= 9.94314 - 10, \\ \log \tan 48^\circ 44'.42 &= 0.05686, & \log \cos 48^\circ 44'.42 &= 9.81919 - 10.\end{aligned}$$

EXAMPLE 3. Given $\log \tan A = 0.53219$. Find A .

Solution. The given logarithm does not appear anywhere in the column at the foot of which is printed the name L. Tan. But we do find in this column

$$\log \tan 73^\circ 38' = 0.53212,$$

$$\log \tan 73^\circ 39' = 0.53259.$$

$$\text{Tabular difference for } 1' = 0.00047.$$

The given value of $\log \tan A$ is $\frac{7}{47}$, or $\frac{15}{100}$, of the way from the first toward the second of these tabular logarithms. Therefore

$$A = 73^\circ 38'.15.$$

TABLE III

The trigonometric functions of angles near 0° or 90° . If we wish to determine an angle for which $\log \cos A = 9.99998 - 10$, Table II cannot furnish an accurate result. We find, by referring to the table, that A may have any value between $0^\circ 29'$ and $0^\circ 36'$.

A small angle cannot be determined, with any degree of accuracy, from the value of its cosine.

In the same way, we see that *an angle very close to 90° cannot be determined accurately from the value of its sine.*

In most cases we shall be able to modify the formula, which we are using, in such a way as to avoid this difficulty. If, for instance, the angle A (known to be very small) is to be determined from the value of its cosine, we shall seek some other formula as a solution of the same problem by means of which the angle A can be determined from the value of its sine or tangent. The problem then reduces to that of finding a small angle when its sine or tangent is given. If we again refer to our table, we find that this problem also gives rise to a difficulty. The method of interpolation, which we ordinarily use, becomes both cumbersome and inexact in the case of such small angles, because the tabular differences are very large and change very rapidly from one place in the table to another.

In order to meet this difficulty, we have provided a separate table (Table III), giving the values of the logarithmic functions for every second of arc from $0^\circ 0'$ to $0^\circ 3'$ and from $89^\circ 57'$ to 90° , and for every ten seconds from 0° to 2° and from 88° to 90° .

TABLE IV

The auxiliary quantities S and T . Table IV provides a second method for meeting the difficulties which are encountered when dealing with angles near 0° or 90° . The method is based on the fact that the quotients

$$\frac{\sin \theta}{\theta} \text{ and } \frac{\tan \theta}{\theta}$$

change very slowly if θ is a small angle.

The formulæ given on the face of the table contain all the necessary directions, so that it will suffice to give some illustrative examples.

PROBLEM 1. Find the sine and tangent of $1^\circ 13'.21$ by using the auxiliaries S and T .

Solution. Since $\theta = 1^\circ 13'.21$, we have $\theta' = 73'.21$.

$$\begin{array}{rcl} \log \theta' = 1.86457 & & \log \theta' = 1.86457 \\ S = 6.46369 - 10 & & T = 6.46379 - 10 \\ \hline \log \sin \theta = 8.32826 - 10 & & \log \tan \theta = 8.32836 - 10 \end{array}$$

PROBLEM 2. Given $\log \sin \theta = 8.24798 - 10$. Find θ .

Solution. We find from Table IV corresponding to $\log \sin \theta = 8.24798 - 10$, $S = 6.46370$. The formula $\log \theta' = \log \sin \theta - S'$ leads to the calculation

$$\begin{array}{rcl} \log \sin \theta = 8.24798 - 10 & & \\ S = 6.46370 - 10 & & \\ \hline \log \theta' = 1.78428 & \therefore & \theta' = 60'.85 = 1^\circ 0'.85. \end{array}$$

TABLE V

Table V contains the four-place values of the sine, cosine, tangent, and cotangent of all angles from 0° to 90° for every tenth of a degree. The following examples will serve to explain its arrangement and use.

PROBLEM 1. Find the functions of $35^\circ.2$.

Solution. In the left-hand column find $35^\circ.2$. The four numbers which are printed in the horizontal row to the *right* of $35^\circ.2$ are, *from left to right*, the sine, tangent, cotangent, and cosine of $35^\circ.2$, as indicated by the name printed at the *head* of each of these columns. Therefore

$$\begin{array}{l} \sin 35^\circ.2 = 0.5764, \tan 35^\circ.2 = 0.7054, \cot 35^\circ.2 = 1.4176, \\ \cos 35^\circ.2 = 0.8171. \end{array}$$

PROBLEM 2. Find the functions of $54^\circ.8$.

Solution. In the right-hand column find $54^\circ.8$. The four numbers which are printed in the horizontal row to the *left* of $54^\circ.8$ are, *from right*

to *left*, the sine, tangent, cotangent, and cosine of $54^{\circ}.8$, as indicated by the name printed at the *foot* of each of these columns. Therefore

$$\sin 54^{\circ}.8 = 0.8171, \tan 54^{\circ}.8 = 1.4176, \cot 54^{\circ}.8 = 0.7054, \\ \cos 54^{\circ}.8 = 0.5764.$$

Thus every number of the table does double duty. For example, 0.5764 is both the sine of $35^{\circ}.2$ and the cosine of $54^{\circ}.8$, as it should be.

Angles less than 45° are given in the left-hand column of the table, and the names of the corresponding functions are found at the *top* of the page. Angles greater than 45° are given in the right-hand column with the names of the functions at the *bottom* of the page.

The table gives the values of the functions only for every tenth of a degree. If the given angle contains fractional parts of this unit, its functions cannot be read directly from the table. In such cases we make use of the process of **interpolation**, the nature of which will become apparent from the following examples.

PROBLEM 3. Find the sine of $35^{\circ}.17$.

Solution. This angle lies between $35^{\circ}.1$ and $35^{\circ}.2$. More precisely, it lies $\frac{7}{10}$ of the way from the former toward the latter. We conclude that its sine will be $\frac{7}{10}$ of the way from

$$\sin 35^{\circ}.1 = 0.5750 \text{ toward } \sin 35^{\circ}.2 = 0.5764.$$

But the difference d between these last two numbers is 0.0014, seven tenths of which is equal to 0.0010 (reduced to four decimal places). Therefore

$$\sin 35^{\circ}.17 = 0.5750 + 0.0010 = 0.5760.$$

PROBLEM 4. Find the cotangent of $35^{\circ}.17$.

Solution. From the table we find

$$\begin{array}{rcl} \cot 35^{\circ}.1 & = & 1.4229 \\ \cot 35^{\circ}.2 & = & 1.4176 \\ d = \cot 35^{\circ}.2 - \cot 35^{\circ}.1 & = & -0.0053 \end{array} \quad (\text{tabular difference})$$

We must add $\frac{7}{10}$ of d to $\cot 35^{\circ}.1$. But $\frac{7}{10} d = -0.0037$.

Therefore

$$\cot 35^{\circ}.17 = 1.4192.$$

We observe that in problem 3 the correction was positive, while in problem 4 it was negative.

If we always interpolate from the smaller toward the larger angle, the correction will be positive in the case of sine and tangent, negative in the case of cosine and cotangent. For, the former two functions *increase* with the angle, while the latter two *decrease*.

There will never be any serious danger of giving the wrong sign to the correction, if we cultivate the habit of running through the numbers of the table near the place we are using, so as to see in which direction they are growing.

PROBLEM 5. The tangent of an unknown acute angle A is equal to 0.7046. Find the angle A .

Solution. We observe that the number 0.7046 does not occur in the tangent column. However, we find there the two numbers 0.7028 and 0.7054, between which 0.7046 lies. Thus we have

$$\begin{aligned}\tan 35^{\circ}.1 &= 0.7028, \\ \tan A &= 0.7046, \\ \tan 35^{\circ}.2 &= 0.7054.\end{aligned}$$

Between $\tan 35^{\circ}.1$ and $\tan A$, the difference is 0.0018.

Between $\tan 35^{\circ}.1$ and $\tan 35^{\circ}.2$, the difference is 0.0026.

Therefore, $\tan A$ is $\frac{1}{2}\frac{18}{26}$ of the way from $\tan 35^{\circ}.1$ toward $\tan 35^{\circ}.2$, and consequently

$$A = 35^{\circ}.1 + \frac{1}{2}\frac{18}{26} \text{ of one tenth of a degree,}$$

or

$$A = 35^{\circ}.1 + 0^{\circ}.07 = 35^{\circ}.17$$

reducing to the nearest hundredth of a degree.

PROBLEM 6. Find the acute angle A whose cosine is 0.5772.

Solution. We have, from the table and the data of the problem,

$$\begin{aligned}\cos 54^{\circ}.7 &= 0.5779, \\ \cos A &= 0.5772, \\ \cos 54^{\circ}.8 &= 0.5764,\end{aligned}$$

whence

$$\begin{aligned}\cos A - \cos 54^{\circ}.7 &= -0.0007, \\ \cos 54^{\circ}.8 - \cos 54^{\circ}.7 &= -0.0015.\end{aligned}$$

Therefore, $\cos A$ is $\frac{7}{15}$ of the way from $\cos 54^{\circ}.7$ toward $\cos 54^{\circ}.8$. Hence

$$A = 54^{\circ}.7 + \frac{7}{15} \text{ of one tenth of a degree}$$

or

$$A = 54^{\circ}.7 + 0^{\circ}.05 = 54^{\circ}.75.$$

TABLE VI

The arrangement and use of this table will be apparent from the following examples.

EXAMPLE 1. Find the squares of 0.324 and of 3.24.

Solution. In the left-hand column of Table VI we find 0.32. In the same horizontal row with this number, and in the column headed 4, we find 0.1050. Therefore

$$(0.324)^2 = 0.1050, \quad (3.24)^2 = 10.50.$$

EXAMPLE 2. Find the squares of 0.3243, of 3.243, and of 32.43.

Solution. From the table we find

$$(0.324)^2 = 0.1050, \quad (0.325)^2 = 0.1056.$$

The difference between the two squares is 0.0006. The number 0.3243 is three tenths of the way from 0.324 toward 0.325. Therefore, its square will be three tenths of the way from 0.1050 toward 0.1056. That is

$$(0.3243)^2 = 0.1050 + \frac{3}{10} \text{ of } 0.0006 = 0.1050 + 0.0002 = 0.1052,$$

and

$$(3.243)^2 = 10.52, \quad (32.43)^2 = 1052.$$

EXAMPLE 3. Find the square root of 0.5520.

Solution. We find from the table that this number is the square of 0.743. Therefore

$$\sqrt{0.5520} = 0.743.$$

EXAMPLE 4. Find the square root of 0.5525.

Solution. The table gives

$$\sqrt{0.5520} = 0.743, \quad \sqrt{0.5535} = 0.744.$$

Therefore, by interpolation

$$\sqrt{0.5525} = 0.743 + \frac{5}{15} \text{ of } 0.001 = 0.743 + 0.0003 = 0.7433.$$

In using Table VI the following remarks are important.

1. To a change of **one** place in the position of the decimal point in a number N , corresponds a change of **two** places of the decimal point in N^2 .

2. To a change of **two** places in the position of the decimal point in N , corresponds a change of **one** place in \sqrt{N} .

TABLE VII

Table VII enables us to save time in converting an angle which is expressed in minutes and seconds to decimal parts of a degree and *vice versa*. Its arrangement and use is so obvious as to require no explanation.

TABLE VIII

Table VIII is merely a collection of some frequently occurring numbers and their logarithms.

TABLES IX, X, AND XI

These tables are three-place tables, arranged and used in accordance with the same principles that have been explained in connection with the larger five- and four-place tables. They should be used whenever the accuracy required for the result is properly expressed by numbers of two or three digits.

TABLE III

LOGARITHMS

OF THE

TRIGONOMETRIC FUNCTIONS

From $0^{\circ} 0'$ to $0^{\circ} 3'$, and from $89^{\circ} 57'$ to 90° , for every second.

From 0° to 2° , and from 88° to 90° , for every ten seconds.

NOTE.—The characteristic of every logarithm in the following table is too large by 10. Therefore, -10 should be written after every logarithm.

L Sin and L Tan				0°		L Sin and L Tan

TABLE IV

THE AUXILIARIES S' AND T'

1. If θ is an angle between 0° and 2° and θ' represents the number of minutes in the angle θ , the following formulae involving the quantities S' and T' are convenient.

$$\begin{aligned}\log \sin \theta &= \log \theta' + S', & \log \theta' &= \log \sin \theta - S', \\ \log \tan \theta &= \log \theta' + T', & \log \theta' &= \log \tan \theta - T', \\ \log \cot \theta &= \text{colog} \tan \theta, & \log \theta' &= \text{colog} \cot \theta - T'.$$

2. If θ is an angle between 88° and 90° and $(90^\circ - \theta)'$ represents the number of minutes in the angle $90^\circ - \theta$, we have

$$\begin{aligned}\log \cos \theta &= \log (90^\circ - \theta)' + S', & \log (90^\circ - \theta)' &= \log \cos \theta - S', \\ \log \cot \theta &= \log (90^\circ - \theta)' + T', & \log (90^\circ - \theta)' &= \log \cot \theta - T', \\ \log \tan \theta &= \text{colog} \cot \theta, & \log (90^\circ - \theta)' &= \text{colog} \tan \theta - T'.$$

TABLE VIII — CONSTANTS

MATHEMATICAL CONSTANTS

Ratio of circumference of a circle to its	LOGARITHM
diameter $\pi = 3.14159265$	0.49714987
One radian = $57^{\circ}.29578$	1.75812263
One radian = $3437'.74677$	3.53627388
One radian = $206264''.806$	5.31442513
One degree = 0.01745329 radians	8.24187737 — 10
One minute = 0.00029089 radians	6.46372612 — 10
One second = 0.00000485 radians	4.68557487 — 10
Sin $1''$ = 0.00000485	4.68557487 — 10
Base of natural logarithms $e = 2.71828183$. . .	0.43429448
Modulus of common logarithms $M = 0.43429448$	9.63778431 — 10

RELATION BETWEEN ENGLISH AND METRIC STANDARDS OF LENGTH

1 inch = 2.54001 centimeters,	1 centimeter = 0.393700 inches.
1 foot = 0.304801 meters,	1 meter = 3.28083 feet.
1 mile = 1.60935 kilometers,	1 kilometer = 0.62137 miles.
1 nautical mile = 6080.27 feet = 1.85325 kilometers.	

GEODETIC, ASTRONOMICAL, AND PHYSICAL CONSTANTS

Equatorial semi-diameter of the Earth (Clarke),	3963.3 miles.
Polar semi-diameter of the Earth (Clarke),	3949.8 miles.
Equatorial horizontal parallax of Sun,	$8''.80$.
Mean distance of Sun from the Earth,	92,897,000 miles.
Mean parallax of the moon,	$57' 2''$.
Mean distance of the Moon from the Earth,	238,840 miles.
Velocity of light in vacuum (Newcomb),	186,326 miles per second.
Velocity of sound in dry air at 0° centigrade,	1090 feet per second.

TABLE IX

THREE-PLACE VALUES OF THE TRIGONOMETRIC FUNCTIONS

Angle	Sin	Tan	Sec	Csc	Cot	Cos	
0°	.000	.000	1.000	∞	∞	1.000	90°
1	.017	.017	1.000	57.299	57.290	1.000	89

Right Triangles

$$\begin{aligned} 2\pi &= .49715 \\ \pi &= 3.14159 \end{aligned}$$

$$A + B = 90^\circ$$

$$a^2 + b^2 = c^2$$

$$\text{Sine of } A = \frac{\text{opp. side}}{\text{hyp}} = \frac{a}{c}$$

$$\text{Cos } A = \frac{\text{adj side}}{\text{hyp}} = \frac{b}{c}$$

$$\text{Tan } A = \frac{\text{opp. side}}{\text{adj side}} = \frac{a}{b}$$

$$\text{Cot } A = \frac{\text{adj side}}{\text{opp side}} = \frac{b}{a}$$

$$\text{Sec } A = \frac{\text{hyp}}{\text{adj side}} = \frac{c}{b}$$

$$\text{csc } A = \frac{\text{hyp}}{\text{opp side}} = \frac{c}{a}$$

1. Sine or Cos never greater than uni

$$\text{Sin } A \text{ csc } A = 1.$$

$$\text{Cos } A \text{ sec } A = 1.$$

$$\text{Tan } A \text{ cot } A = 1.$$

$$\text{Tan } A = \frac{\text{Sin } A}{\text{Cos } A}$$

$$\text{Cot } A = \frac{\text{Cos } A}{\text{Sin } A}$$

$$\text{Sin}^2 A + \text{Cos}^2 A = 1.$$

I given 2 sides of Δ including rt \angle = (Two legs)

$$\text{Tan } A = \frac{a}{b}, c = \frac{a}{\text{Sin } A} = \frac{b}{\text{Cos } A}, B = 90^\circ - A$$

II

given one leg and hyp. - a, c

$$\text{Sin } A = \frac{a}{c}, b = a \text{ cot } A = c \text{ Cos } A, B = 90^\circ - A$$

III

given 1. hyp. and one acute \angle = A, c

$$b = a \text{ cot } A, a = \frac{c}{\text{Sin } A} = \frac{b}{\text{Cos } A}, B = 90^\circ - A$$

IV

given hyp and one acute \angle = A, c

$$a = c \text{ Sin } A, b = c \text{ Cos } A, B = 90^\circ - A$$

$$\text{Law of sines} = \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

$$\text{Law of Tan} = \frac{a-b}{a+b} = \frac{\tan \frac{1}{2}(A-B)}{\tan \frac{1}{2}(A+B)}$$

$$\text{Law of Cos} = a^2 = b^2 + c^2 - 2bc \cos A$$

$$\text{Area} = S = \sqrt{S(S-a)(S-b)(S-c)}$$

$$\text{Radius} = r = \frac{\sqrt{S(S-a)(S-b)(S-c)}}{S}$$

$$\text{Mollweide's Formula} = \frac{a-b}{c} = \frac{\sin \frac{1}{2}(A-B)}{\cos \frac{1}{2}C}$$

I Given 2 sides + included side
law of sines
check: Mollweide's formula

II Given 3 sides

$$s = \frac{1}{2}(a+b+c), \quad r = \frac{\sqrt{(s-a)(s-b)(s-c)}}{s}$$

$$\tan \frac{1}{2} A = \frac{r}{s-a}, \quad \tan \frac{1}{2} B = \frac{r}{s-b}, \quad \tan \frac{1}{2} C = \frac{r}{s-c}$$

$$\text{check} = A+B+C = 180^\circ$$

III given 2 sides + included \angle
law of \tan .
law of \sin
check: Mollweide's Formula

IV given 2 sides and \angle opposite

$$a > b = \text{law of sines}$$

$$rt \Delta = rt \Delta \text{ solution}$$

$$a < b = \text{two solutions}$$
